

BSD SpecLink®-E

Looking for an intelligent and easy way to manage specs? One that's interoperable with the latest BIM software? One that stays up-to-date? Then don't look any further than BSD SpecLink-E.

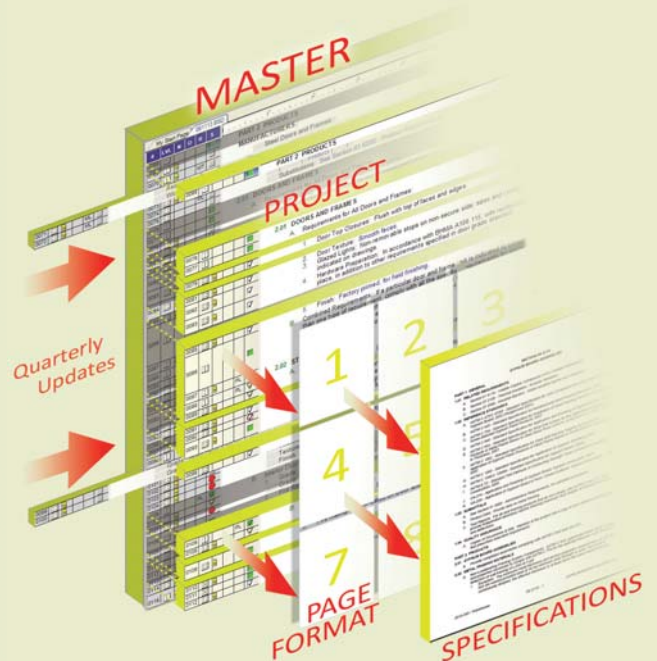

Looking for an intelligent and easy way to manage specs? One that's interoperable with the latest BIM software? One that stays up-to-date? Then don't look any further than BSD SpecLink-E.

SpecLink-E is the most technologically advanced spec product on the market – and it links to Revit. It's the most comprehensive collection of guide specs available with 600 master sections covering all disciplines – and it's applicable to all project delivery methods. No wonder it's used for over 27,000 commercial, industrial and institutional projects a year.

Features:

- SpecLink-E is a single database of master guide specification sections that can be collapsed or expanded to produce specs for all project phases – from programming through construction
- It's designed by architects and engineers for ease of data customization and ease of maintenance
- It employs an innovative overlay system that stores master data and project data separately while merging them for editing and printing
- It includes a sophisticated updating system that eliminates overwriting or file replacement and offers maximum editing flexibility
- It uses over 125,000 intelligent links built into the database to multiply productivity by automatically including or excluding text based on user choices
- It has thousands of context-sensitive “notes to the specifier” in a separate window from the spec text
